Water Disinfection and Natural Organic Matter R.

A. Minear 1996 As part of the effort to balance
water treatment processes between allowing
pathogenic infection by doing too little, and raising
the risk of cancer with by-products of the
treatment, 20 papers from a symposium in
Chicago, August 1995, present information on the

chemical identity of natural organic matter and its interactions with the inorganic precursor bromide ion. They review the history of natural organic matter in water treatment and the impact of regulations, then plunge into reports on an economical experimental approach to developing predictive models for by-products of disinfection, a comparison of analytical techniques for determining cyanogen chloride in chloraminated drinking water, the effect of ozonation and biotreatment on molecular size and hydrophilic fractions of natural organic matter, removing bromate ion by electric-arc discharge and high-

energy electron beam processes, and other topics. Annotation copyrighted by Book News, Inc., Portland, OR
