Shadow Education and Social Inequalities in Japan Steve R. Entrich 2017-12-07 This book examines why Japan has one of the highest enrolment rates in cram schools and private tutoring worldwide. It sheds light on the causes of this high dependence on 'shadow education' and its implications for social inequalities. The book provides a deep and extensive understanding of the role of this kind of education in Japan. It shows new ways to theoretically and empirically address this issue, and offers a comprehensive perspective on the impact of shadow education on social inequality formation that is based on reliable and convincing empirical analyses. Contrary to earlier studies, the book shows that shadow education does not inevitably result in increasing or persisting inequalities, but also inherits the potential to let students overcome their status-specific disadvantages and contributes to more opportunities in education. Against the background of the continuous expansion and the convergence of shadow education systems across the globe, the findings of this book call for similar works in other national contexts, particularly Western societies without traditional large-scale shadow education markets. The book emphasizes the importance and urgency to deal with the modern excesses of educational expansion and education as an institution, in which the shadow education industry has made itself (seemingly) indispensable.

**King Lear** William Shakespeare 2020-11-09 King Lear is a tragedy by Shakespeare, written about 1605 or 1606. Shakespeare based it on the legendary King Leir of the Britons, whose story is outlined in Geoffrey of Monmouth's pseudohistorical History of the Kings of Britain (written in about 1136). The play tells the tale of the aged King Lear who is passing on the control of his kingdom to his three daughters. He asks each of them to express their love for him, and the first two, Goneril and Regan do so effusively, saying they love him above all things. But his youngest daughter, Cordelia, is compelled to be truthful and says that she must reserve some love for her future husband. Lear, enraged, cuts her off without any inheritance. The secondary plot deals with the machinations of Edmund, the bastard son of the Earl of Gloucester, who manages to convince his father that his legitimate son Edgar is plotting against him. After Lear steps down from power, he finds that his elder daughters have no real respect or love for him, and treat him and his followers as a nuisance. They allow the raging Lear to wander out into a storm, hoping to be rid of him, and conspire with Edmund to overthrow the Earl of Gloucester. The play is a moving study of the perils of old age and the true

meaning of filial love. It ends tragically with the deaths of both Cordelia and Lear—so tragically, in fact, that performances during the Restoration period sometimes substituted a happy ending. In modern times, though, King Lear is performed as written and generally regarded as one of Shakespeare's best plays. This Standard Ebooks edition is based on William George Clark and William Aldis Wright's 1887 Victoria edition, which is taken from the Globe edition. **Numerical Methods for Nonlinear Engineering Models** John R. Hauser 2009-03-24 There are many books on the use of numerical methods for solving engineering problems and for modeling of engineering artifacts. In addition there are many styles of such presentations ranging from books with a major emphasis on theory to books with an emphasis on applications. The purpose of this book is hopefully to present a somewhat different approach to the use of numerical methods for engineering applications. Engineering models are in general nonlinear models where the response of some appropriate engineering variable depends in a nonlinear manner on the application of some independent parameter. It is certainly true that for many types of engineering models it is sufficient to approximate the real physical world by some linear model. However, when engineering environments are pushed to extreme conditions, nonlinear effects are always encountered. It is also such extreme conditions that are of major importance in determining the reliability or failure limits of engineering systems. Hence it is essential that engineers have a toolbox of modeling techniques that can be used to model nonlinear engineering systems. Such a set of basic numerical methods is the topic of this book. For each subject area treated, nonlinear models are incorporated into the discussion from the very beginning and linear models are simply treated as special cases of more general nonlinear models. This is a basic and fundamental difference in this book from most books on numerical methods.

*Starting Up* Lisa Arrastia 2015-04-24 Starting Up is a collection of first-person accounts by some of the best-known founders of new schools in America. Providing the kind of knowledge that only experience can teach, it is an invaluable resource for anyone in the process of or thinking about opening a new school, as well as those interested in the politics of today's era of new school development. The authors share how they worked to make their educational aspirations a reality while wrestling with social and economic obstacles, such as the distressed state of the communities in which these schools operated and the constant competition for resources. Starting Up tells real stories that capture the rich sense of possibility that currently exists for urban education. Book Features: Behind the scenes accounts from the founders of innovative K-12 schools created to better serve primarily poor communities across the country. Lessons learned from school leaders, including both the rewards and challenges associated with starting a new

school. An introduction by Pedro Noguera that situates start ups within current economic and political realities. Lisa Arrastía is the middle school principal at United Nations International School in New York. Her work in the classroom is the focus of the Emmy-nominated PBS documentary Making the Grade. Marvin Hoffman is the founding director of The University of Chicago Charter School, North Kenwood/Oakland campus and the associate director of the University's Urban Teacher Education Program. "These are educators who recognize that although urban public schools are often deeply flawed and dysfunctional, they don't have to be, and they are educators who act on the belief that it is possible to create schools that nurture and support the hopes and aspirations of those they serve." -From the Foreword by Pedro Noguera, New York University "How might we reimagine our schools? This book offers a guide from those who have experienced firsthand the trials and tribulations of trying to create a school from the bottom up. It asks all the right questions, both the practical and the pedagogical. It feels like essential reading as we reconsider how our urban schools should look and function." -Alex Kotlowitz, bestselling author of There Are No Children Here and The Other Side of the River

Probability and Partial Differential Equations in Modern Applied Mathematics  
Edward C. Waymire 2010-06-14 "Probability and Partial Differential Equations in Modern Applied Mathematics" is devoted to the role of probabilistic methods in modern applied mathematics from the perspectives of both a tool for analysis and as a tool in modeling. There is a recognition in the applied mathematics research community that stochastic methods are playing an increasingly prominent role in the formulation and analysis of diverse problems of contemporary interest in the sciences and engineering. A probabilistic representation of solutions to partial differential equations that arise as deterministic models allows one to exploit the power of stochastic calculus and probabilistic limit theory in the analysis of deterministic problems, as well as to offer new perspectives on the phenomena for modeling purposes. There is also a growing appreciation of the role for the

inclusion of stochastic effects in the modeling of complex systems. This has led to interesting new mathematical problems at the interface of probability, dynamical systems, numerical analysis, and partial differential equations. This volume will be useful to researchers and graduate students interested in probabilistic methods, dynamical systems approaches and numerical analysis for mathematical modeling in the sciences and engineering.
